

One rainy night Cyneca, Abigail, Adam, and Dylan were walking at night. Suddenly they ran into a cloud named Puffer. He told them about a raindrop named Jett. Jett went through 4 stages of the water cycle. Here is the story about Jett going through the 4 stages of the Water Cycle.

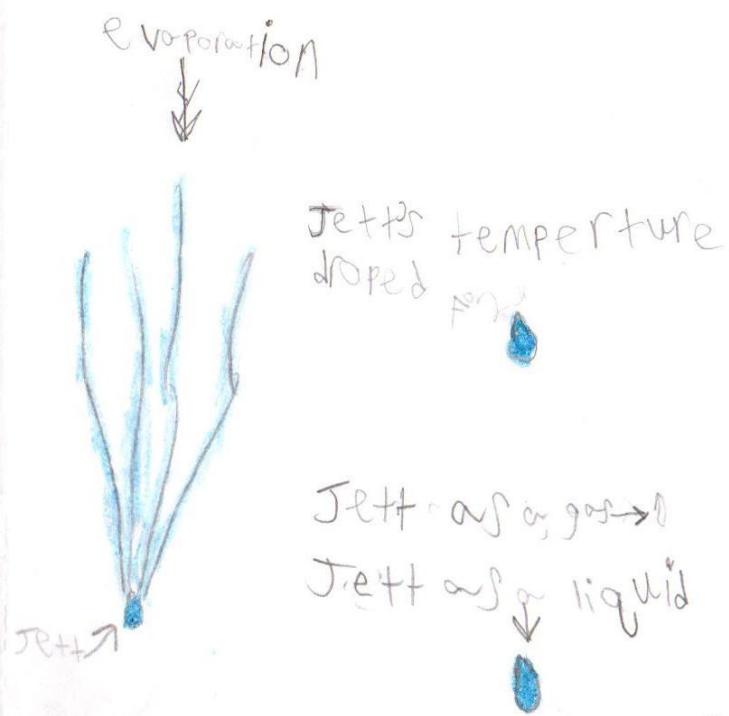

First, Puffer told us that Jett was evaporated three times. He fell from the sky. Then turned into gas. Jett floated up to the clouds. When he got up there to the clouds he froze. Jett came down as rain, he had 4 choices of rain, snow, sleet, or hail. After he fell he went through condensation.

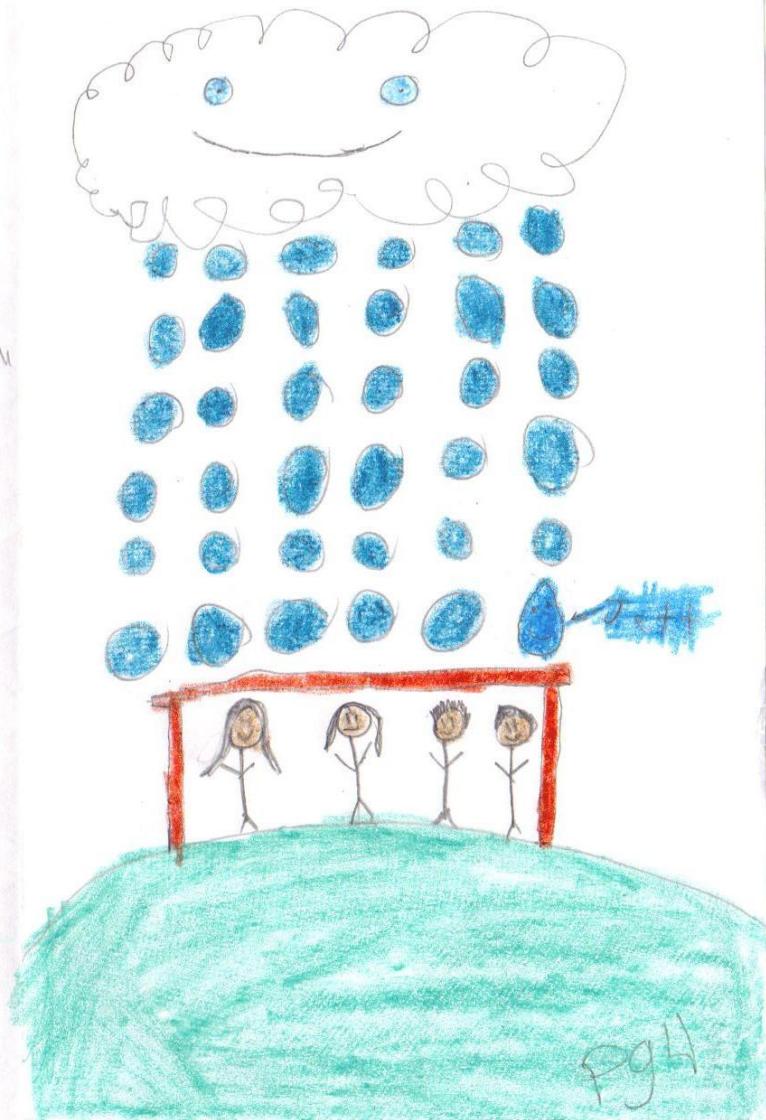

Pg 2

After Jet went through evaporation he went to condensation and changed from a gas into a liquid. After Jet turned into a liquid and the temperature decreased and when Jet's temperature decreased it moved on to precipitation.

Precipitation

Then, Puffer said, "Jett went to the 3rd stage which is called (Precipitation)." "He told them that after (Condensation) Jett is put into Precipitation, which is when water gets heavy. Precipitation is when water gets heavy and falls to earth. It is when raindrops form to make a bigger raindrop." "Finally said Puffer" We will talk about the next stage."

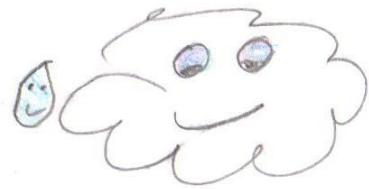

Transpiration

Transpiration is the last stage that Jett has to go through the water cycle. Transpiration follows Precipitation in the water cycle. It has 10 percent of the moisture in the atmosphere. During the final process the plants absorb the water from the soil. The water moves through roots to the stems to the leaves. The plants then lose water through their leaves. That plants is want transpiration is like and what Jett had to go through.

That is the end of the story
And heres a summary of Jett.
First Jett was evaporated and turned
into a liquid. Next Jett went through
Condensation and change to a gas.
Then Jett went through Precipitation
and fell to the earth. Last he
went through transpiration and
went from roots to the leaves
